

Structured Volume Decomposition via Generalized Sweeping

Supplemental material - table of the performance report and mesh statistics

Xifeng Gao, Tobias Martin, Sai Deng, Elaine Cohen, Zhigang Deng, and Guoning Chen

TABLE 1

Statistics of hex-meshes with multi-resolutions. The subscripts of models, e.g., $w_1u_2v_2$, indicates the initial numbers of samples in the W, U , and V directions are 1, 2, 2, respectively, excluding the corner points; $Comp$ is the abbreviation of “Component”. We measure the total timings of the whole pipeline excepting the harmonics function design part in minutes.

For all the meshes shown in the paper, $\epsilon = 1.5$, and the number of iterations for corner point alignment is 100. The hex-mesh quality is measured by the length, volume (average/standard deviation) and scaled Jacobians (average/minimum), respectively.

Models	#Hex	Meshing	Length	Volume	Scaled Jacobian	#Slice	#Comp

⁺ and * denote the hex-mesh are undergone bifurcation splitting and padding process, respectively. Note that all the three resolutions of our meshes have positive minimum and high average Jacobians.
