Introduction to Data Visualization

Alark Joshi

What is Data Visualization?

- Visual Representation of Data
- For exploration, discovery, insight, ..
- Interactive component provides more insight as compared to a static image

Image credits: Yahoo Finance, IBM

Types of Data Visualization

- Scientific Visualization
 - Structural Data Seismic, Medical, ..
- Information Visualization
 - No inherent structure News, stock market, top grossing movies, facebook connections
- Visual Analytics
 - Use visualization to understand and synthesize large amounts of multimodal data – audio, video, text, images, networks of people ..

Scientific Visualization

Visualize data sets of size, from small to very large on desktop computers or high-performance clusters, using this open-source, multi-platform application.

Information Visualization

Visual Analytics

- Integration of interactive visualization with analysis techniques to answer a growing range of questions in science, business, and analysis.
- Making sense of multimodal data -audio clips, video, photographs, transcripts, ...

Impact of Visualization

- Huge impact on policy, planning and disaster avoidance.
- Florence Nightingale's visualization of casualties during the Crimean War

Impact of Visualization

• Hurricane Visualization for the common man

Impact of Visualization

- John Snow's Cholera Map
- Snow used a spot map to illustrate how cases of cholera clustered around the pump

A Short Introduction on **Data** Visualization

Guoning Chen

Data is generated everywhere and everyday

Age of Big Data

Companies in all sectors have at least 100 terabytes of stored data in the United States; many have more than 1 petabyte

Storage data by sector derived from IDC.

- 2 Firm data split into sectors, when needed, using employment
- 3 The particularly large number of firms in manufacturing and health care provider sectors make the available storage per company much smaller.

SOURCE: IDC; US Bureau of Labor Statistics; McKinsey Global Institute analysis

What is Visualization?

- In 1987
 - the National Science Foundation (of the U.S.) started "Visualization in scientific computing" as a new discipline, and a panel of the ACM coined the term "scientific visualization"
 - Scientific visualization, briefly defined: The use of computer graphics for the analysis and presentation of computed or measured scientific data.
- Oxford Engl. Dict., 1989
 - to form a mental vision, image, or picture of (something not visible or present to the sight, or of an abstraction); to make visible to the mind or imagination
- Visualization transforms data into images that effectively and accurately represent information about the data.
 - Schroeder et al. The Visualization Toolkit, 2nd ed. 1998

Tool to enable a User insight into Data

Turning invisible into visible that people can understand intuitively

Table 7-4 Direct global warming potentials of several well-mitted ince gases neither to CO₂. The GWPs, b for writes anon-CO₂ species are activated for sear to five sime houtons [23, 50, 100, 200 and 500 years) aring, as in (PCC, the cation cycle model of Singentrate (1983), (Note that (PCC contained a typographical intro which did is incorrect whate for the since CMPP of mathema)

members 2006)

What Does Visualization Do?

- Three types of goals for visualization
 - ... to explore
 - Nothing is known,
 - Vis. used for data exploration
 - ... to analyze

- There are hypotheses,
- Vis. used for Verification or Falsification
- … to present
 - "everything" known about the data,
 - Vis. used for Communication of Results

Image source: Google images

This is a well rich and inter-disciplinary area that combines knowledge from various disciplines

A Visualization Pipeline

This pipeline represents only the lecturer's opinion and need not reflect the opinions of NSF or UH!

Data Visual <u>Analytic</u> Pipeline

This pipeline represents only the lecturer's opinion and need not reflect the opinions of NSF or UH!

Evolution of Visualization Research

- From <u>direct</u> visualization to <u>derived</u> information visualization.
- From <u>simple</u> data to more <u>complex</u> ones.
- From represent the data with <u>fidelity</u> to reveal <u>new</u> <u>findings</u>.
- From scientific visualization to information visualization, bio-visualization, geographical data visualization, and beyond.

<u>SciVis vs. InfoVis</u>

- Information visualization focuses on:
 - high-dimensional (>>4), abstract data (i.e. tree, graphs, hierarchy, ...)
 - Data is discrete in the nature
 - Examples include financial, marketing, HR, statistical, social media, political,
 - Feature are not well-defined, the typical analysis tasks including finding patterns, clusters, voids, outliers

Use Colors Wisely

What is Wrong with this Color Scale

Not a bad choice of color scale, but the Dynamic Range needs some work

Use the Right Transfer Function Color Scale to Represent a Range of Scalar Values

- Gray scale
- Intensity Interpolation
- Saturation interpolation
- Two-color interpolation
- Rainbow scale
- Heated object interpolation
- Blue-White-Red

Image: Constraint of the second s

Given any 2 colors, make it *intuitively obvious* which represents "higher" and which represents "lower"

Do Not Attempt to Fight Pre-Established Color Meanings

Color Meanings

Examples of Pre-Established Color Meanings

Red	Green	Blue
Stop	On	Cool
Off	Plants	Safe
Dangerous	Carbon	Deep
Hot	Moving	Nitrogen
High stress	Money	
Oxygen		
Shallow		

Money loss

Use good contrast as human eye is good at difference

at difference

Color Alone Doesn't Cut It

Luminance Contrast is Crucial

I would prefer that my life depend on being able to read this quickly and accurately!

The Luminance Equation

$Y = 0.3 \times Red + 0.59 \times Green + 0.11 \times Blue$

Material from Dr. Mike Bailey, Oregon State Univ.

≈ Contrast Table

	Black	White	Red	Green	Blue	Cyan	Magenta	Orange	Yellow
Black	0.00	1.00	0.30	0.59	0.11	0.70	0.41	0.60	0.89
White	1.00	0.00	0.70	0.41	0.89	0.30	0.59	0.41	0.11
Red	0.30	0.70	0.00	0.29	0.19	0.40	0.11	0.30	0.59
Green	0.59	0.41	0.29	0.00	0.48	0.11	0.18	0.01	0.30
Blue	0.11	0.89	0.19	0.48	0.00	0.59	0.30	0.49	0.78
Cyan	0.70	0.30	0.40	0.11	0.59	0.00	0.29	0.11	0.19
Magenta	0.41	0.59	0.11	0.18	0.30	0.29	0.00	0.19	0.48
Orange	0.60	0.41	0.30	0.01	0.49	0.11	0.19	0.00	0.30
Yellow	0.89	0.11	0.59	0.30	0.78	0.19	0.48	0.30	0.00

 ΔL^* of about 0.40 are highlighted and recommended

Use good contrast

ose Br	Black	Black	Black	Black	Black	Black	Black	Black
White		White	White	White	White	White	White	White
Red	Red		Red	Red	Red	Red	Red	Red
Yellow	Yellow	Yellow		Yellow	Yellow	Yellow	Yellow	Yellow
Green	Green	Green	Green	Green		Green	Green	Green
Blue	Blue	Blue	Blue	Blue	Blue	Blue		Blue

ΔL* of about 0.40 makes good contrast

Other Rules...

- Limit the total number of colors if viewers are to discern information quickly.
- Be aware that our perception of color changes with: 1) surrounding color; 2) how close two objects are; 3) how long you have been staring at the color; 4)sudden changes in the color intensity.
- Beware of Mach Banding.
- Be Aware of Color Vision Deficiencies (CVD)

It is not possible to list all the useful rules. They come with a lot of experience!

Beware of Color Pollution

Just because you have millions of colors to choose from

doesn't mean you must use them all •••

Some Principles for Plots

Some Funcipies for Flors

Visualizing Data [Cleveland 93] and *Elements of Graphing Data* [Cleveland 94] by William S. Cleveland

The information provided here should be considered as guidelines

- Why are they all different?
- What is good/bad about each?

- <u>Principle 1</u>: Reduced clutter, Make data stand out
 - The main focus of a plot should be on the data itself, any superflous elements of the plot that might obscure or distract the observer from the data needs to be removed.

Which one is better?

- <u>Principle 2</u>: Use visually prominent graphical elements to show the data.
 - Connecting lines should never obscure points and points should not obscure each other.
 - If multiple samples overlap, a representation should be chosen for the elements that emphasizes the overlap.
 - If multiple data sets are represented in the same plot (superposed data), they
 must be visually separable.
 - If this is not possible due to the data itself, the data can be separated into adjacent plots that share an axis

- <u>Principle 3</u>: Use proper scale lines and a data rectangle.
 - Two scale lines should be used on each axis (left and right, top and bottom) to frame to data rectangle completely.
 - Add margins for data
 - Tick-marks outs and 3-10 for each axis

- <u>Principle 4</u>: Reference lines, labels, notes, and keys.
 - Only use them when necessary and don't let them obscure data.

- <u>Principle 4</u>: Reference lines, labels, notes, and keys.
 - Only use them when necessary and don't let them obscure data.

Fig. 1. Xenon-133 activity (picocuries per cubic meter of air) in Albany, New York, for the end of March and early April 1979. The lower trace shows the time-averaged estimates of releases (curies per second) from the Three Mile Island reactor (2). The inset shows detailed values for air samples (gas counting) and concurrent average values for ambient air (Ge diode). Abbreviation: LT, less than.

- <u>Principle 5</u>: Superposed data set
 - Symbols should be separable and data sets should be easily visually assembled.

- <u>Principle 1</u>: Provide explanations and draw conclusions
 - A graphical representation is often the means in which a hypothesis is confirmed or results are communicated.
 - Describe everything, draw attention to major features, describe conclusions
 Fig. 2. Tension and the intensity of the 42.9-

nm layer line during 1-second tetanus at the sarcomere length of 2.2 µm. (a) Tension record averaged over the 40 tetanic contractions required for obtaining the time course of the layer-line intensity. A sartorius muscle was dissected from Rana catesbeiana and tetanized for 1 second at 2-minute intervals. The horizontal line represents the period of stimulation. Tension was recorded with an isometric tension transducer (Shinkoh, type UL). (b) Intensity of the first-order myosin layer line at 42.9 nm. The x-ray source was a rotating-anode generator (Rigaku FR) with a fine focus (1.0 by 0.1 mm) on a copper target. This was operated at 50 kV with a tube current of 70 mA; such a high power was possible with an anode of a large diameter (30 cm) rotating at a high speed (9000 rev/ min). A bent-crystal monochromator was used at a source-to-crystal distance of 25 cm with a viewing angle of 6°. The intensity of the myosin layer line was measured with a scintillation counter combined with a mask; the mask had apertures at the positions of the off-meridional parts of the first-order

layer line. The meridional reflection at 14.3 nm is known to be slightly displaced during contraction, suggesting a minute change in the myosin periodicity (I, 3). It is, therefore, possible that the 42.9-nm layer line is also slightly displaced. However, the possible displacement (14 μ m at the position of the mask) would be insignificant compared with the width of each aperture (0.8 mm). The intensity measured at the resting state was 1400 count/sec. The intensities during and after tetanus were expressed as percentages of the resting intensity and plotted against time after the first stimulus of each set of stimuli. Each point represents the intensity averaged over a 100-msec period. The first three points represent the measurements made before stimulation.

- <u>Principle 2</u>: Use all available space.
 - Fill the data rectangle, only use zero if you need it

- <u>Principle 3</u>: Align juxtaposed plots
 - Make sure scales match and graphs are aligned

- <u>Principle 4</u>: Use log scales when appropriate
 - Used to show percentage change, multiplicative factors and skewness

• <u>Principle 5</u>: Bank to 45^o

- Optimize the aspect ratio of the plot

Summary of Principles

- Improve vision
 - 1. Reduced clutter, Make data stand out
 - 2. Use visually prominent graphical elements
 - 3. Use proper scale lines and a data rectangle
 - 4. Reference lines, labels, notes, and keys
 - 5. Superposed data set
- Improve understanding
 - 1. Provide explanations and draw conclusions
 - 2. Use all available space
 - 3. Align juxtaposed plots
 - 4. Use log scales when appropriate
 - 5. Bank to 45^{*o*}

VISUALIZING YOUR DATA EFFECTIVELY

Kim Unger – Fall 2017

ABOUT ME

Senior Analytics Consultant, DataBrains

Former SSEF, ISEF, STS Finalist

Science Fair Judge (regional, SSEF, ISEF)

Data Visualization is my day-to-day job

kunger@databrains.com

AGENDA

Overview – four questions

Choosing the right chart/graph

Other visualizations

Visual Best Practice

Tableau – Visualization software

FOUR QUESTIONS

- 1. What data is **important to show**?
- 2. What do I want to emphasize in the data?
- 3. What **options** do I have for displaying this data?
- 4. Which option is **most effective** in communicating the data?

Chart Suggestions—A Thought-Starter

WHAT DO YOU WANT TO SHOW WITH YOUR DATA?

TIME SERIES VALUES DISPLAY HOW SOMETHING CHANGED OVER TIME

Bar Graph (vertical) To feature individual values and support their comparisons. Quantitative scale must begin at zero.

Line Graph To feature overall trends and patterns and support their comparisons

Strip Plot (multiple)

Only when also featuring distributions

Box Plot (vertical)

RANKING VALUES ARE ORDERED BY SIZE (DESCENDING OR ASCENDING)

Bar Graphs Quantitative scale must begin at zero

PART-TO-WHOLE VALUES REPRESENT PARTS (RATIOS) OF A WHOLE

Bar Graphs Quantitative scale must begin at zero

WHAT ABOUT PIE CHARTS?

Commonly used to show parts of a whole

However...

- > Hard to judge relative size of pie slices better at differentiating length
- > Take up a lot of space to **present little information**
- **Require labels and good color contrast** to even be usable (often difficult)

Best use is when one overwhelmingly larger value than the rest – no need to focus on actual values

DEVIATION DIFFERENCE BETWEEN TWO SETS OF VALUES

Bar Graphs Quantitative scale must being at zero

Line Graph Only when also featuring time series or single distribution

DISTRIBUTION COUNT OF VALUES PER INTERVAL ALONG QUANTITATIVE SCALE

CORRELATION COMPARISON OF TWO PAIRED SETS OF VALUES TO DETERMINE IF THERE IS A RELATIONSHIP BETWEEN THEM

VISUAL BEST PRACTICES

Emphasize	most important data		
Orient	graphs for legibility		
Organize	graph/table		
Avoid	overloading graphs		
Limit	# of colors and shapes		
Inform	through important text		

DATA ANALYSIS VS DATA VISUALIZATION

Traditionally enter data into spreadsheet (Excel) Satisfactory, but strengths are in data analysis – not visualization Time consuming to create graph variations

Alternative: Use data visualization software
